PGCLOUD LAUNCHER ● LIVE

v1.0.0 | OPEN SOURCE · GPL-2.0

POSTGRESQL HIGH AVAILABILITY · NO SCRIPTS REQUIRED

Draw your cluster. Press Deploy. Watch it live.

PgCloud Launcher turns **PostgreSQL 18**, **Pgpool-II** and **PgBouncer** into one visual map. Connect the nodes, add SSH access, and it installs every server for you, then watches replication, failover and traffic in real time.

≤ 5 s	**≤ 36 s**	**0**	**~5 min**
TO PROMOTE A REPLICA WHEN THE PRIMARY DIES	OLD PRIMARY BACK AS A REPLICA WITH PG_REWIND	SPLIT-BRAINS ACROSS ALL FAILOVER TESTS	FIRST DEPLOY OF A FULL CLUSTER ON 3 SERVERS

Visual topology
Drag nodes, link them, and the launcher checks roles, ports and SSH before anything runs.

One-click deploy
Over SSH: detects `docker` or `podman`, prepares images, writes config, starts every node in order.

Automatic failover
A replica is promoted, the others follow it and the old primary rejoins by itself with `pg_rewind`.

Real-time monitor
Status, latency, TPS, connections and replication lag of every node, every 3 seconds.

Your images, your way
Build on each server, pull from Docker Hub, or upload a `tar.gz` for air-gapped sites.

Secure by default
SCRAM auth, allowed networks only, AES-256-GCM encrypted secrets, generated passwords.

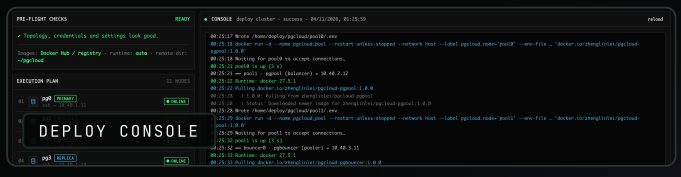

QUICK START

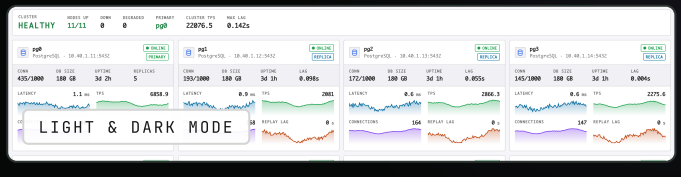

Up and running in one command

```
$ docker run -d --name pgcloud-launcher \
    -p 8080:8080 -v pgcloud-launcher:/data \
    zhenglinlei/pgcloud-launcher:1.0.0
# open http://localhost:8080 → add servers → Deploy
```

PostgreSQL 18.6 | Pgpool-II 4.7.3 | PgBouncer 1.23.1
